

Automated System Outreach if the client gives you set of leads

What this system does is that we take an input spreadsheet of leads from you or a client containing details like the lead's email, name, linkedin URL etc. We will use that information to fill in the fields of an email template with an Ai generated personalizations and then each personalization will be saved in a google doc for each lead in a specific folder. From there we will review the email or modify and send them automatically. This approach is ideal if the client wants to generate the emails and then send them manually from the desired domain saving the time it takes to research a prospect and create a tailored outreach.

- To Set up
 - Open make.com and a new scenario
 - Open a google sheets module and create a connection with the account that has your google sheet
 - Run the module and wait till it retrieves the variables.
 - Next connect a set multiple variables tool and add these variables firstname, companyname, personallinkedIn and companylinkedIn.
 - Run the operation again.
 - For webscraping, we are going to web scrape the leads company linkedn. We will be going to the company's linkedIn and get basically all the text that comes from the URL that they've given.
 - Go to rapidapi.com/restyler/api/scraperapi/pricing
 - Once signed up, switch from shell to HTTP.
 - Now add an HTTP "make a request" module.
 - Add this URL in the HTTP request: <https://scraperapi.p.rapidapi.com/scrape>
 - Change the method to POST and add the headers.
 - For the Text parser module, add the HTML which will be the data block from your last HTTP request.
 - For the Text parser module, we are going to regex expressions and add the regex to the pattern `(^.*\n?|\n|||N|[\.]*?)https?:V\S+|\n\s*\n)`
 - Replace the new value with "emptystring" and enable global match.
 - Add money to your GPT API keys and then for the openAi module, choose gpt-4o as the model and leave the max tokens at 256.
 - For the google docs module, make a connection and add a new folder.
